The concept of vestiges is crucial in history and archaeology. Ruins of ancient civilizations, such as the pyramids or the remains of the Roman Empire, serve as vestiges of human progress.  -  The ruins had only vestiges of the once-grand palace.
 -  The museum displayed vestiges of an ancient sword. (Use "relics" instead of "vestiges" here.)
 - **What Are Vestigial Structures?**
 - Vestigial structures are body parts that have lost most or all of their original function due to evolution. These structures were once useful in an organism's ancestors but are now redundant or serve a different, often minor, purpose.
 - **Examples of Vestigial Structures in Humans**
 - **Appendix** → Once useful for digesting tough plant material in early human ancestors, now largely unnecessary.
 - **Wisdom Teeth** → Previously helped early humans grind down tough plant matter, but modern diets make them redundant.
 - **Tailbone (Coccyx)** → A remnant of the tail our primate ancestors had, now serving as an attachment point for muscles.
 - **Goosebumps** → Originally used by ancestors to make their body hair stand up for warmth or intimidation, now mostly ineffective.
 - **Auricular Muscles (Ear Muscles)** → Many animals can move their ears to detect sound, but in humans, these muscles are mostly non-functional.
